Aggregation
Execution

$$g \in \{\text{SUM, AVG, MAX, MIN}\}$$
$$y = g(a_1, \dots, a_3)$$

SQLs & Answers

Parallel

one scalar per table, then aggregate

```
-- T1:SELECT value FROM R WHERE company='X'AND sector='AI'→ a1
-- T2:SELECT value FROM R WHERE company='Y'AND sector='AI'→ a2
-- T3:SELECT value FROM R WHERE company='Z'AND sector='AI'→ a3
```

answer
parallel

Sequential

output of step i becomes lookup key of step i+1

```
-- T1:SELECT company FROM CEOs WHERE ceo='John Doe'→ b1
-- T2:SELECT facility FROM Assign WHERE company=b1→ b2
-- T3:SELECT value FROM R&D WHERE facility=b2
    AND sector IN ('AI', 'Finance') → {a1, a2}
```

answer
seq.

Latent Relational Source + Query Provenance Mask

3 Rendering Non-Relational Views

Transformations

Layout edits

- Pivot (hierarchical headers)
- Column merging
- Blank row/column insertion
- Attribute name change

Cell edits

- Typographical noise
- Footnote / text insertion
- Null / N.A. insertion

Numerical edits

- Unit-of-measurement change

Parallel views : each view contributes one independent scalar

Company X			Company Z		
2023 indicators / employee	Branch location		Weekly usage per employee	Rbnach citise	
	UK	US		Lodnon (UK)	Tokoy (Jaapn)
Weekly water usage 2022	5.89 gallons	7.16 gallons	Waetr	2022	0.022m ³
Weekly water usage 2023	5.60 gallons	--		2023	0.024m ³

Sequential views : each lookup key parameterizes the next view

CEO names			R&D expenses		
Year	Compaines		Costs (2023)	Investments (millions)	
	X	Y		AI Research	Finance Research
2022	John Doe	Lee Seo-yeon	Net cost	Atlanta Lab	42.1
2023	Jnae Mya	n.a.		Seoul Lab	53.8 - as written in [1]
